

bytefile layout

```
int sizeof(size_t),  
int numTax,  
size_t numPattern,  
int numPartitions,  
double gappyness
```

}

} header

```
int weights[numPattern]
```

```
int len1,  
char taxonName[len1],  
int len2,  
char taxonName[len2],  
...
```

}

} taxon names

```
partition1{  
int states,  
int maxTipStates,  
size_t lower,  
size_t upper,  
size_t width, (unused)  
int dataType,  
int protModels,  
int autoProtModels,  
int protFreqs,  
boolean nonGTR,  
boolean optimizeBaseFrequencies,  
int numberofCategories,  
int len,  
char partitionName[len],  
double frequencies[states]  
}  
partition 2{  
...  
}  
...
```

}

} partition infos

```
char yVector[numPattern]
```

bytefile layout

```
int sizeof(size_t),  
int numTax,  
size_t numPattern,  
int numPartitions,  
double gappyness  
  
int weights[numPattern]  
  
int len1,  
char taxonName[len1],  
int len2,  
char taxonName[len2],  
...  
  
partition1{  
int states,  
int maxTipStates,  
size_t lower,  
size_t upper,  
size_t width, (unused)  
int dataType,  
int protModels,  
int autoProtModels,  
int protFreqs,  
boolean nonGTR,  
boolean optimizeBaseFrequencies,  
int numberOfCategories,  
int len,  
char partitionName[len],  
double frequencies[states]  
}  
partition 2{  
...  
}  
  
char yVector[numPattern]
```

1. read header, taxa, partitions into ByteFile struct
(use seekPos() to navigate in bytefile)

ByteFile *bFile

....
pInfo* partitions
....

bytefile layout

```
int sizeof(size_t),  
int numTax,  
size_t numPattern,  
int numPartitions,  
double gappyness  
  
} header  
  
int weights[numPattern]
```

```
} taxon names
```

```
partition1{  
int states,  
int maxTipStates,  
size_t lower,  
size_t upper,  
size_t width, (unused)  
int dataType,  
int protModels,  
int autoProtModels,  
int protFreqs,  
boolean nonGTR,  
boolean optimizeBaseFrequencies,  
int numberofCategories,  
int len,  
char partitionName[len],  
double frequencies[states]  
}  
partition 2{  
...  
}  
...  
}
```

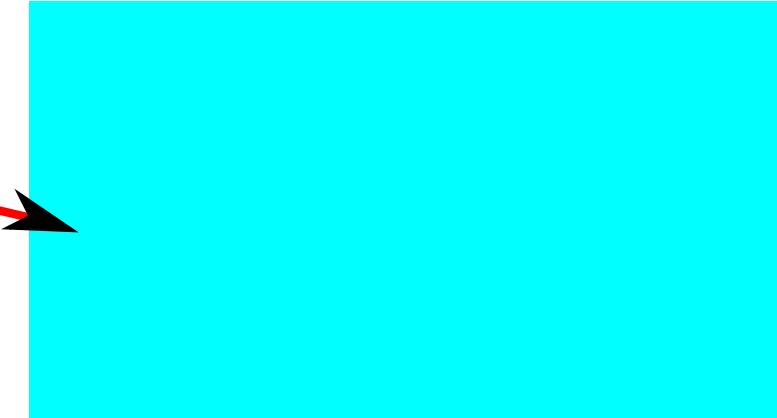

```
char yVector[numPattern]
```

2. every process computes partition assignment

ByteFile *bFile

```
....  
pInfo* partitions  
....
```

PartitionAssignment *pAss

bytefile layout

```
int sizeof(size_t),  
int numTax,  
size_t numPattern,  
int numPartitions,  
double gappyness  
}  
}
```

```
int weights[numPattern]
```

} header

```
int len1,  
char taxonName[len1],  
int len2,  
char taxonName[len2],  
...
```

```
partition1{  
int states,  
int maxTipStates,  
size_t lower,  
size_t upper,  
size_t width, (unused)  
int dataType,  
int protModels,  
int autoProtModels,  
int protFreqs,  
boolean nonGTR,  
boolean optimizeBaseFrequencies,  
int numberofCategories,  
int len,  
char partitionName[len],  
double frequencies[states]  
}  
partition 2{  
...  
}  
...
```

```
char yVector[numPattern]
```

} taxon names

} partition infos

ByteFile *bFile

```
....  
plInfo* partitions  
....
```

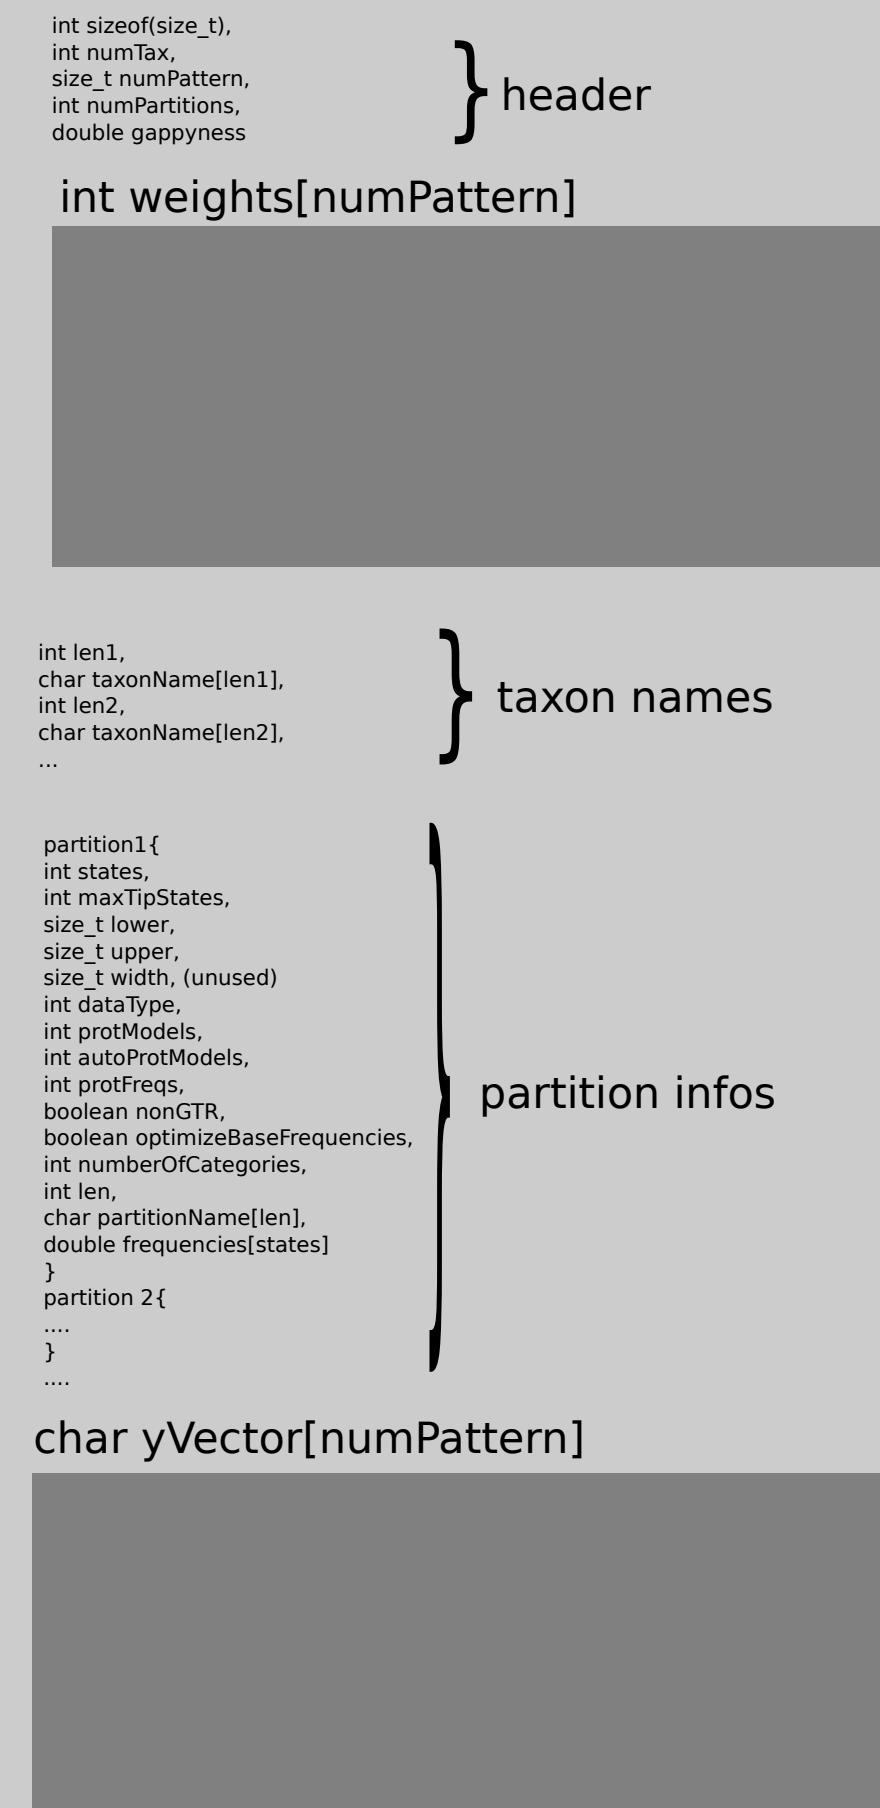

```
partitions[0].yVector  
partitions[0].wgt  
partitions[4].yVector  
partitions[4].wgt
```

PartitionAssignment *pAss

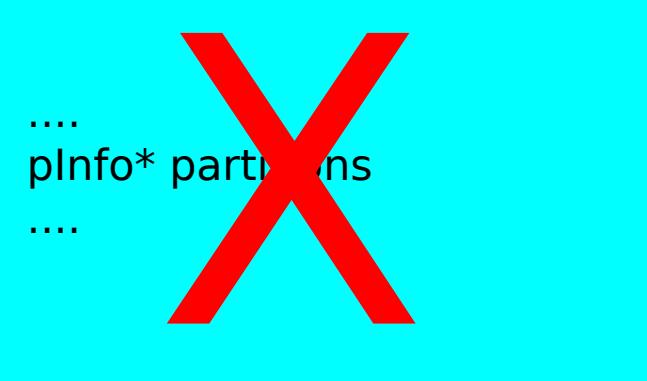

3. process only reads data assigned to it (exa_fread/exa_fseek)

bytefile layout

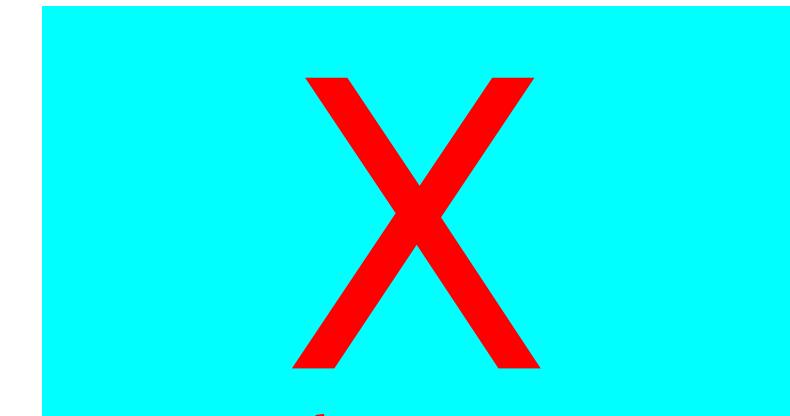

4. tree struct is initialized; bFile and pAss are deleted

`ByteFile *bFile`

`PartitionAssignment *pAss`

`tree *tr`
